

TRANSFORMERS

BY

ALTEC
LANSING CORPORATION

Altec Lansing has developed a complete new line of transformers which have the necessary frequency range, power carrying capacity, low insertion loss, low phase shift, and ample electro-magnetic and electrostatic shielding, good balance of windings for push pull operation, and proper impregnation and treatment so that heat and moisture will not adversely affect their continued operation. Ability to handle the rated power at low frequencies insures that the intermodulation products will be very low.

The use of negative feedback in amplifiers requires that the frequency range of the amplifier must be made much broader than the actual amplification characteristic needed. The required frequency range over which the transmission characteristics of the feedback loop must be controlled is surprisingly high and represents the price that must be paid in order to obtain the benefits of negative feedback.

Altec Lansing transformers, unless otherwise specified, have a transmission range of 20 - 20,000 cycles (± 1 db) and this condition will hold over a range of 60 db in power. In most cases the transformers will have good transmission up to 50 KC so that it is not necessary to use special compensation in the feedback path when the transformer is part of it. The same situation is present at the very low frequencies since in general the transformers will not be down over 3 db at 10 cycles.

TP-255-A

A hybrid or three winding transformer designed to operate from two 500 ohm sources into a 500 ohm load. A balancing resistor of

approximately 250 ohm is required in the primary circuit. For maximum attenuation between the two sources, the exact value of this resistor should be determined from measurements made in the circuits where the transformer is used. The correct value, under average circumstances, will yield a minimum attenuation of from 27 to 30 db over the frequency range between 20 c.p.s. and 10,000 c.p.s., with a maximum attenuation of approximately 50 db at some point between 500 c.p.s. and 1,000 c.p.s. Frequency response from either source to the load is flat within 1 db from 20 c.p.s. to 10,000 c.p.s. and within 2 db from 20 c.p.s. to 20,000 c.p.s. Maximum operating level +15 db (0.2 watt) (6 mw reference). Has an astatically balanced design which attenuates magnetic pickup approximately 30 db.
